Dear Council Members,

Regarding the upcoming discussion of the vision statement for the Comprehensive Plan Update, I would like to put my vote in for placing importance on our islands' fresh water supply. The fact that we don't really know what our natural water resources are makes me very nervous. We do know that water is finite. Please stress the importance of acquiring the scientific data that can measure and monitor our water supply. Without this knowledge, my concern is that we will *think* we have plenty without really *knowing*. Basing future decisions on something less than reality could spell trouble, especially in light of inevitable climate change impacts and population growth.

Thank you for your consideration of this topic.
